

Usability Test Report

DigiDigi Camera Discovery Prototype

Draft template for a two-person usability test. Replace the example observations with the participants' actual feedback before submitting it as a real test report.

Purpose

The purpose of this test is to check whether people can move through the DigiDigi prototype without getting lost, understand the camera recommendations, and find the information they need before making a decision.

The test focuses on the Camera Finder, Match Results, Camera Detail, Compare, and Saved screens. The goal is to find small usability problems before the final UI is prepared.

Participants

Participant	Role in test	Focus
Asiman Mammadli	Participant 1	Main flow and camera details
Musa Nabizada	Participant 2	Navigation, compare and saved flow

Test Tasks

- Find a suitable camera by starting from Home, opening Camera Finder, answering the questions, and reaching Match Results.
- Open the Sony A6700 and check Overview, Specs, Shots, price information, and Used Deals.
- Use Saved or Compare to review shortlisted cameras and understand the differences between options.

Participant Observations

Asiman Mammadli · Participant 1

The main Camera Finder flow was easy to follow. The path from Home to the recommendation screen felt clear, and the questions were simple enough to understand without camera knowledge.

The difference between Overview, Specs, and Shots was easy to understand. One area that may need more attention is Used Deals. It could look more obviously interactive so people know they can open seller options and price details.

Overall, the prototype felt easy to use and the Camera Finder was the strongest part of the experience.

Musa Nabizada · Participant 2

The Finder flow and Match Results were clear. The personalized recommendation helped explain which camera was the best fit instead of forcing the user to compare every specification manually.

The Camera Detail page was easy to scan because the simple overview and technical specifications were separated. The Compare feature took slightly longer to notice, so making it more visible could improve the experience.

Overall, the navigation was understandable and the camera detail structure made the product feel easier to use for a beginner.

What Worked Well

The Camera Finder gave users a clear starting point and reduced the need to understand technical camera terms before getting a recommendation.

The Match Results screen made the recommendation easy to understand, while the Camera Detail structure allowed users to move from a simple overview to deeper technical information only when they wanted it.

The Shots section also supported the decision process by showing what the camera can produce in real use instead of relying only on specifications.

Issues to Address

Issue	Impact	Suggested change
Used Deals does not immediately look interactive	Medium	Make the call-to-action and seller rows more obvious.
Compare can take longer to notice	Medium	Make Compare more visible in camera and saved flows.

Next Design Changes

The next iteration should keep the current Camera Finder and Camera Detail structure because these parts are easy to understand. The main changes should focus on making Compare easier to discover and making Used Deals look more clearly clickable.

Technical information should remain available, but simple explanations and real-world examples should continue to come first for beginner users.

Conclusion

The prototype supports the main DigiDigi journey from discovering a camera to comparing options and making a decision. The primary flow is clear, while the remaining issues are mostly related to the visibility of secondary actions rather than the overall structure of the product.
