ACCESSIBILITY REVIEW

Core checks

● Contrast

Primary text uses Navy 700 (#03111F) on light backgrounds. Secondary text uses Neutral 500 (#667085) where appropriate. Primary actions use high-contrast Navy text on Coral backgrounds. Interactive states remain visually distinguishable.

● Typography & Readability

Body text uses a minimum size of 16px. Secondary text uses 14px, while captions are reserved for supporting metadata. Consistent line heights and a clear heading hierarchy improve scanning and readability.

● Tap Targets

Primary buttons use a 48px height. Icon buttons use a minimum 44 × 44px interaction area. Navigation items meet minimum touch-target requirements, with enough spacing to reduce accidental taps.

● Form Usability

Labels remain visible above input fields. Focus states are clearly visible. Error messages explain the problem directly. Disabled fields are visually distinct, and password inputs include a visibility control.

Navigation Clarity

Primary destinations remain consistent across the product: Home, Finder, Community, Compare, and Saved. Icons are supported by text labels, and the active destination is visually distinct without relying on color alone.

USABILITY IMPROVEMENTS

Research-driven refinements

The following changes are based on the simulated usability review and are presented as design refinements, not as findings from real participant testing.

● Beginner-Friendly Terminology

Observation: Technical camera terminology may be difficult for beginners.

Improvement: Simplified labels and added beginner-friendly descriptions to reduce jargon and cognitive load.

● Guided Discovery

Observation: The camera discovery process benefits from stronger guidance.

Improvement: Improved Finder hierarchy and recommendation clarity so users can understand why a camera matches their needs.

● Comparison Confidence

Observation: Users need clear signals when comparing options.

Improvement: Strengthened comparison hierarchy, match information, and pricing visibility.

● Used-Camera Trust

Observation: Trust information is critical when evaluating used cameras.

Improvement: Added seller reputation, condition, and warranty information to make purchasing decisions easier.

Change Notes

A concise record of the component, responsive, accessibility, and usability improvements made during Week 3.

01

Component Library

Created reusable buttons, inputs, cards, and navigation components with consistent sizing and interaction states.

02

Responsive System

Defined responsive behavior for mobile and desktop layouts using the DigiDigi grid system and reusable layout rules.

03

Accessibility

Improved text contrast, readable typography, touch-target sizing, and the visibility of interaction states.

04

Form Usability

Standardized labels, focus states, validation feedback, disabled states, and password-field visibility controls.

05

Navigation

Improved navigation consistency, active-state visibility, and label clarity across primary destinations.

06

Usability Improvements

Applied refinements from the simulated usability review to improve discovery, terminology, comparison clarity, and trust signals.
